

## Résumé de projet Professionnel

I created a mobile app with 3 of my colleagues from scratch. This app is dedicated to Us sport fanatic (especially NBA, NFL and NHL)

The different screens are the following :

- Registration
- Login
- Directory (page listing users)
- User Details (page displaying information about a user)
- Profile (access to user information with the ability to modify it)
- Chat (general chat page)

This application is developed in React Native, which allows for a smooth and intuitive development experience. The backend uses Node.js and follows the principles of the REST API. The libraries used are express.js for handling routes and Sequelize as the ORM.

To save time, I leveraged Expo, eliminating the need for separate Android and iOS development. Expo's tools and services streamlined development and simplified deployment.

Le back-office est en Next.js, ce qui permet une gestion facile des données et une grande flexibilité dans la conception de l'interface utilisateur.

In summary, my project involves creating a chat app with Node.js and React Native using Expo. It improves my mobile app development proficiency while meeting the demand for fast and secure communication.
